**Product Description**

The 18-bit PI74AVC16834 universal bus driver is designed for 1.8V to 3.6V  $V_{CC}$  operation.

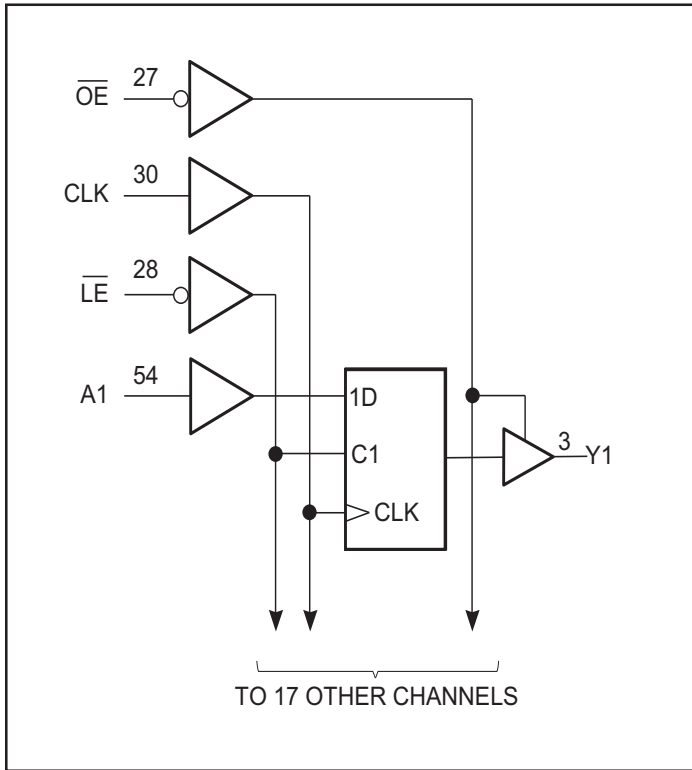

Data flow from A to Y is controlled by Output Enable ( $\overline{OE}$ ). The device operates in the transparent mode when  $\overline{LE}$  is LOW. The A data is latched if CLK is held at a high or low logic level. If  $\overline{LE}$  is HIGH, the A-bus is stored in the latch/flip-flop on the low-to-high transition of CLK. When  $\overline{OE}$  is HIGH, the outputs are in the high-impedance state.

The PI74AVC16834 bus driver is designed to drive an array of 133 MHz synchronous memory chips, with minimal undershoot/overshoot noise, and to meet the input signal rise/fall time requirement of memory chips.

The output drivers of this part have an embedded series-resistor. For DIMM module design, no external series termination resistors near the buffer drivers or any other termination resistors are required. This feature simplifies DIMM module layout design, and results in cost savings.
